1 Overview of the Programme

- The BSc in Actuarial Mathematics programme provides students with a firm foundation in mathematics, computing and statistics for careers as actuaries in particular, or in finance in general. It is also suitable for students who may be interested in research, teaching, or other non-financial areas. Specifically, the programme provides the opportunity to gain exemptions from some of the professional actuarial examinations. It is a challenging programme both in terms of breadth of application and intellectual depth. Enjoyment of mathematics, problem-solving and an interest in the applications of mathematics are important prerequisites.
- The programme is of four years' duration and may be divided into two parts. In the first four semesters (i.e. in the first and second years) students are introduced to a wide range of mathematical subjects to allow them to make informed choices about subjects in the fourth year. In the latter semesters, students may select subjects with varying degrees of emphasis on actuarial or financial mathematics. Details of the subjects are set out in Section 4.

¹ As part of a re-structuring of the School's degree programmes, the BSc in Actuarial Mathematics became the new title for the BSc in Financial & Actuarial Mathematics programme and has applied to all students entering the programme from September 2008 onwards.

² This version of the document was created on 16th August 2017.

- It is possible for students to be recommended for exemption from some of the professional actuarial examinations. Performance in particular modules may lead to recommendations for exemptions in these professional subjects. Details of the possible exemptions are set out in Section 6.
- An important feature is INTRA, a programme under which the University attempts to place students in relevant commercial employment, normally in the second semester of year three. This is an opportunity for students to gain valuable employment experience in an appropriate commercial area.
- Modern business and industry need sophisticated mathematical and allied skills. While the programme is specifically designed for an actuarial career or careers in finance, it is also useful for graduates who may wish to progress to research, teaching or employment in business or industry generally.

2 Programme Aims & Objectives

- The educational philosophy underpinning this programme is that there is intrinsic value attached to acquiring a deep knowledge of mathematics; knowledge of the role of applied mathematics in science and society; knowledge and experience of the use of technology in mathematics; the ability to generate and contribute new knowledge to the areas of actuarial science and financial mathematics.
- The aims of the programme are the following:
 - To provide a strong grounding in basic mathematical principles, with a strong emphasis on the use of computers at every stage;
 - To ensure a knowledge of areas of application of mathematics in actuarial science, risk management and financial engineering;
 - To ensure competence in statistical methods and stochastic processes and their use to model demographic and actuarial concepts;
 - To develop problem-solving skills, analytical reasoning and critical thinking in relation to the assumptions underlying any mathematical models formulated within the course;
 - To give students an opportunity to gain experience of employment in the financial and actuarial services areas during the programme.
- The specific objectives for the programme are:
 - To introduce students to the concepts and applications of actuarial studies as an academic discipline, appropriate to the attainment level of an undergraduate degree in actuarial mathematics.
 - To offer students the opportunity to gain exemptions from a number of the professional examinations of the Institute & Faculty of Actuaries;
 - To introduce students to subjects which do not form part of the professional actuarial syllabus currently but which are nevertheless of interest to actuaries.

The nature of a mathematics programme is such that the majority of the time is spent acquiring and honing analytical and problem-solving skills. Apart from problem-solving skills, the programme incorporates, to some extent, learning skills, management skills and information technology skills:

- Analytical & Problem Solving Skills:

Virtually all modules will develop abstract thinking and problem-solving skills. This is the feature of mathematics programmes most valued by employers.

- Information Technology:
 - The full-year, first-year Computing module was dedicated to C++ programming from 2008/09 to 2011/12 inclusive, after which time the programming language will be Matlab (the second-year Numerical Mathematics module, in which 25% is allocated to computing assignments, will switch to Matlab from 2013/14 onwards).
 - Information technology will be used in the delivery of many modules in the form of 'Loop' (formerly 'Moodle') pages, and it is anticipated that, for most if not all students, the Industrial Placement (INTRA) in third year will involve Excel, VBA programming or the use of some other computer packages.
- Communication Skills:

The Industrial Placement in third year will have a large and practical communication element.
- Resource Management Skills:

The modules Introduction to Microeconomics, Introduction to Macroeconomics and the Mathematics of Finance are delivered during the first two years of the degree. These courses will increase economic awareness and will help the students to make more informed financial decisions in both business and personal settings.
- Learning Skills:

University-level mathematics requires a different learning method than pre-university mathematics. Part of the difficulty encountered by students in mathematics programmes is making this transition. The first-year module 'Mathematical Concepts & Skills' will address the issue of independent learning to assist students in making this transition, while the modules Sequences & Series in first year, together with Analysis and Differential Equations in second year, will address the change to abstract thinking, using the method of guided enquiry.

3 Intake & Entry Requirements

- The programme can be accessed exclusively through the Central Applications Office (CAO code DC126). The entry requirement (in addition to the general conditions set by the University) is a grade H3 or higher in Higher-Level Mathematics in the Irish Leaving Certificate examination. Where a school-leaving examination other than the Leaving Certificate is presented, an equivalent grade in Mathematics will be required.
- There is also an alternative entry mechanism via the common entry route, which has a designated CAO code (DC127) and is entitled the Common Entry into Actuarial, Financial and Mathematical Sciences (CAFM). The entry requirement (in addition to the general conditions set by the university) is also a grade H3 or higher in Higher-Level Mathematics in the Irish Leaving Certificate examination, in line with the standard required for direct entry into the BSc in Actuarial Mathematics programme.
- The entry requirement equates to a score of at least 75% on the average of two examination papers in Higher-Level Leaving Certificate Mathematics. Where a school-leaving examination other than the Leaving Certificate is presented, an equivalent grade in Mathematics will be required.
- At the end of the second year, students on the common entry degree will be ranked based on their second-year results. In order of merit, students will then choose places on the BSc in Actuarial Mathematics or the BSc in Financial Mathematics. At any particular stage, a maximum of 50 students per year on either degree will be permitted. Admission to the BSc in Actuarial Mathematics will also be subject to the approval of the Progression & Awards Board, in consultation with the External and Independent Examiners for that degree.

4 Programme Structure & Assessment

- The modules which make up the programme are core or option modules in semesters 1 and 2, or year-long linked modules, core or option. Each module carries the credit value given below. Successful completion of each year of the programme has an ECTS credit value of 60.
- Within the Bologna Declaration, it is proposed that European Higher Education should be based on courses which are compatible with the European Credit Transfer System (ECTS). ECTS is a tool for conversion between national education systems and is an important instrument in removing barriers to mobility. The two main elements of ECTS are a credit system and a grading scale. In the ECTS credit system, one year of full-time study corresponds to 60 credits. ECTS also offers a grading scale which can be used to convert grades awarded in one national system into the most closely-corresponding grade in another system. The two elements, when used together, enable a student's learning achievement in one institution to be recognised by another.
- The distribution of modules across the programme years is presented in Table 1. The following points should be noted:
 - Year 1: Modules 1, 2, 3 and 4 are core in Semester 1, modules 5, 6, 7, 8 and 9 are core in Semester 2, and module 10 is a year-long core module.
 - Year 2: Modules 11 to 15 are core in Semester 1 and modules 16 to 20 are core in Semester 2.
 - Year 3: Modules 21 to 25 are core in Semester 1. Students undertake a 32-week industrial placement (INTRA) commencing at the beginning of Semester 2.
 - Year 4: Modules 27 and 28 are core in Semester 1 and students must choose two of the Semester 1 option modules 29 to 32. Modules 33 to 35 are core in Semester 2 and students must choose one of the Semester 2 option modules 36 to 38.
- The core idea underpinning the learning philosophy of this degree is that graduates in applied mathematics must accumulate a combination of knowledge, skills and modes of thinking in order to succeed in bringing their education to bear in their future careers. We see this accumulation as happening on a gradual basis, with students starting at a level where they must review and refine their school-mathematics knowledge and skills and begin the process of reflecting on the nature of mathematics and their engagement with it.
- In subsequent years, students will become more independent in their learning: modules dealing specifically with helping students to make this transition from years one and two. In particular, the flow of modules is designed with a view to helping student to make the transition to the stage where they can construct their own formal mathematical arguments.

ACM 2017/ 2018					
No.	Code	Module Title	Credits	Terminal Examination	Continuous Assessment

Year 1

1	MS103	Linear Mathematics 1	5	80%	20%
2	MS111	Mathematical Concepts & Skills	5	70%	30%
3	MS112	Differential Calculus	5	75%	25%

Table 1: 2017/18 Modules by ACM Programme Year

- The guiding philosophy behind the assessments is to develop and test the understanding and mastery of the various skills required of a graduate in applied mathematics. The assessment methods will aim towards the measurement of specific module learning outcomes and the encouragement of creativity, critical thinking and academic writing skills.
- The assessment of the modules will be by continuous assessment, project work and terminal examination or by a combination of these elements. The nature of the assessment and percentage marks allocated to the elements of continuous assessment will vary depending on the module. Table 1 indicates the relative breakdown of marks between continuous assessment (CA) and terminal examination (TE) for each module.
- Strict adherence to the University's Marks & Standards will be observed in all matters relating to progression regulations, compensation regulations, accumulation of credits, the attainment levels for award classifications and regulations regarding repeat attempts. With the exception of the 15 actuarial exemption modules (listed in Table 2), all the taught modules in the programme are eligible for compensation as defined in the Marks & Standards.
- A brief summary of the main progression regulations and award classifications is given below:
 - The pass mark is 40%.
 - In order to progress from one year of study to the next, students must pass all modules, either unequivocally or by means of compensation (in accordance with such regulations as are in place prescribed for the programme of study).
 - Classification of the final-degree award will be based on the final-year modules:

First-Class Honours	70%—100%
Second-Class Honours, Grade 1	60%—69%
Second-Class Honours, Grade 2	50%—59%
Third-Class Honours	40%—49%

- A student who fails a module, or who does not take a full set of examinations in the final year of the programme, is normally eligible for third-class honours only.

5 Programme Changes

- Year 4 of the ACM programme became available for the first time in 2011/12. While there was no change to the originally-accredited programme in terms of CT-associated modules, some new core and option modules were added. The full set of module specifications for Year 4 were approved by the Accreditation Panel of the Institute & Faculty of Actuaries and the then Independent and External Examiners.
- From February 2011, the School of Mathematical Sciences assumed responsibility for the teaching of CT3-associated modules CA255 and CA258. With some re-distribution of the CT3 learning objectives across modules, the module codes were amended to MS255 and MS258 respectively.
- On a phased basis (see Tables 3, 4, 5 and 6), the original CT2-associated modules of EF107A and AC334 were replaced by AC316 and EF316 (the latter two were the CT-associated modules in the old Financial & Actuarial Mathematics programme). While all the CT2 learning objectives remained in place, there was some necessary re-organization of material across modules. AC316 was taken by ACM2 students for the first time in 2011/12 while EF316 was taken by ACM3 students for the first time in 2012/13.

- From 2013/14, two additional option modules (MS339 and MS341) were added to the ACM4 suite of modules from which module MS551 was removed (see Table 7). Additionally, module MS447 moved from Semester 1 to Semester 2. Also, from 2013/14 onwards, the title of module MS306 changed from Treasury Mathematics to Work-Based Skills.
- From 2014/15 (see Table 8), three new optional modules were added (two in Semester 1, namely MS437: Probability & Finance I and MS408: Probability & Finance II, and one in Semester 2, namely MS426: Stochastic Finance). Module MS455: Simulation for Finance changed from being core to optional in Semester 1. Optional modules MS339: Mechanics and MS341: Algebra were removed from Semester 1.
- A decision was taken by the School Teaching Meeting in March 2014 to the effect that the overall degree-precision score will be based on a weighted average of the years 2, 3 and 4 precision-year scores, with weightings of 25%, 15% and 60% for years 2, 3 and 4 respectively, and that this arrangement would come into operation for the first time for final-year students presenting in 2017/18.
- From 2015/16 (see Table **Error! Reference source not found.**), the three, first-year modules MS105, MS108 and MS109 (totalling 20 credits) were replaced by four 5-credit modules (Mathematical Concepts & Skills and Differential Calculus in Semester 1 and Integral Calculus and Sequences & Series in Semester 2). The year-long, 10-credit first-year Economics module EF110 was split into two 5-credit modules (EF113: Introduction to Microeconomics in Semester 1 and EF114: Introduction to Macroeconomics in Semester 2). Also, the 5-credit, second-year module Complex Variable was removed from the academic structures, with the credit ratings for Analysis (formerly Analysis II) and Probability II being correspondingly increased from 5 to 7.5 credits.
- 2016/ 2017 – no changes to programme structures.
- 2017/2018 – A new module, MS324 – Financial and Actuarial Data Analysis, was added as a core module in semester 1 of year 3. The optional work-based skills module was removed. The INTRA module in year 3, semester 2 was reduced to 25 credits and the module code changed to IN314. The code for module Actuarial Modelling was changed to MS338 and the credits reduced to 5.

6 CT Series Subjects 2017/18

CT Series Subject	DCU Modules
CT1 Financial Mathematics	MS318
CT2 Finance & Financial Reporting	AC316, EF316
CT3 Probability & Mathematical Statistics	MS117, MS255, MS258
CT4 Models	MS308, MS338
CT5 Contingencies	MS448
CT6 Statistical Methods	MS447, MS449
CT7 Economics	EF113, EF114
CT8 Financial Economics	MS427, MS428
